2.5 Viète's Product

WORKSHEET

The question

STEP III 2022, Question 4

Read the question before you go on. It is in the STEP III paper in OCR's download of the 2022 STEP papers (a zip file):

www.ocr.org.uk/Images/696587-2022-past-papers.zip

Hints

Try the question on your own first. If you get stuck, read the hints *one at a time*, and go back to the question after each one. Hints marked *Pause and try* are the key steps.

Ask yourself What is the double-angle formula for sinh? (If you are not sure, write $\sinh 2y$ and $\sinh y \cosh y$ in terms of exponentials and compare.)

STAGE 1 Halving repeatedly

Ask yourself Suppose the formula holds for n. The last factor is $\sinh(x/2^n)$. How can you rewrite it to get the formula for $n+1$?

STAGE 3 A formula for $\ln 2$

Ask yourself What is the general pattern for $\cosh(x/2^k)$? What happens when you multiply all the denominators $2 \times 2^{1/2^k}$ together?

STAGE 4 Viète's formula

Ask yourself Part (iv) has π in it, so it must come from ordinary trigonometry, not hyperbolic functions. Does everything in parts (i) and (ii) still work with sin and cos in place of sinh and cosh?

Pause and try Choose x so that the left-hand side is $2/\pi$, and work out the first few factors. The half-angle formula $\cos\frac{\theta}{2} = \sqrt{\frac{1+\cos\theta}{2}}$ (for $0 \le \theta \le \pi$) will be useful.

Try this next

1. **The 1990 version.** Try STEP I 1990, Question 8 (step.maths.org/questions/90-s1-q8). It reaches Viète's product by a different route from this section, using nothing beyond the double-angle formula for sin. Which approach do you find more natural?

2. **Another angle.** Use $x = \frac{\pi}{3}$ in the product for $\frac{\sin x}{x}$ to write $\frac{3\sqrt{3}}{2\pi}$ as an infinite product, and simplify the first two factors.

3. **How many factors?** Use a calculator to find how many factors of Viète's product are needed to give π correct to 4 decimal places. Explain why each extra factor gains about 0.6 of a digit.

4. **A formula for $\ln 3$.** Repeat part (iii) with $x = \ln 3$ to write $\frac{1}{\ln 3}$ as an infinite product.

How many factors are needed to give $\frac{1}{\ln 3}$ to two decimal places? Why does this product converge more slowly than Viète's?
