5.4 Distances in a Regular Polygon

WORKSHEET

The question

STEP III 2016, Question 7

Read the question before you go on. It is in the STEP Support Programme's question database:

step.maths.org/questions/16-s3-q7

Hints

Try the question on your own first. If you get stuck, read the hints *one at a time*, and go back to the question after each one. Hints marked *Pause and try* are the key steps.

Ask yourself Put the polygon's vertices at the nth roots of unity, $X_k = \omega^k$. If P is the point z, what is $|PX_k|$ in terms of z? So what is the product of all the distances?

STAGE 2 A point on the perpendicular bisector

Ask yourself So P is $z = te^{i\pi/n}$ for some real t (positive or negative), with $|OP| = |t|$. What is z^n?

Pause and try What happens when n is odd? Consider $t > 0$ and $t < 0$ separately, and say what each case means geometrically.

STAGE 3 Chords from a vertex

Ask yourself Now $P = X_0$, and one of the distances, $|X_0X_0|$, is zero, so $|z^n - 1| = 0$ is no use. What polynomial has the roots $\omega, \omega^2, \ldots, \omega^{n-1}$ but not 1?

Try this next

1. **Check small cases.** Verify part (ii) directly for a square ($n = 4$) and an equilateral triangle ($n = 3$).

2. **Through a vertex.** Show that if P lies on the ray from O through X_0, then $|PX_0| \times \cdots \times |PX_{n-1}| = ||OP|^n - 1|$.

3. **The average distance.** Using part (ii) and the AM–GM inequality of Section 3.2, show that the average length of the $n-1$ chords from X_0 is at least $n^{1/(n-1)}$. Find the actual average, $\frac{1}{n-1}\sum_k 2\sin\frac{k\pi}{n}$, for $n = 6$, and compare.

4. **All the chords.** HARDERShow that the product of all $\binom{n}{2}$ chord lengths of a regular n-gon inscribed in a unit circle is $n^{n/2}$.
