12.5 The Last Passenger's Seat

WORKSHEET

The question

A train has n seats, where $n \geq 2$. For a particular journey, all n seats have been sold, and each of the n passengers has been allocated a seat. The passengers arrive one at a time and are labelled $T_1, \ldots, T_n$ according to the order in which they arrive: T_1 arrives first and T_n arrives last. The seat allocated to T_r $(r = 1, \ldots, n)$ is labelled S_r.

Passenger T_1 ignores their allocation and decides to choose a seat at random (each of the n seats being equally likely). However, for each $r \geq 2$, passenger T_r sits in S_r if it is available or, if S_r is not available, chooses from the available seats at random.

(i) Let P_n be the probability that, in a train with n seats, T_n sits in S_n. Write down the value of P_2 and find the value of P_3.

(ii) Explain why, for $k = 2, 3, \ldots, n-1$,

$$\mathrm{P}(T_n \text{ sits in } S_n \mid T_1 \text{ sits in } S_k) = P_{n-k+1},$$

and deduce that, for $n \geq 3$,

$$P_n = \frac{1}{n}\left(1 + \sum_{r=2}^{n-1} P_r\right).$$

(iii) Give the value of P_n in its simplest form and prove your result by induction.

(iv) Let Q_n be the probability that, in a train with n seats, T_{n-1} sits in S_{n-1}. Determine Q_n for $n \geq 2$.

Hints

Try the question on your own first. If you get stuck, read the hints *one at a time*, and go back to the question after each one. Hints marked *Pause and try* are the key steps.

Pause and try Work out P_2 and P_3 by listing what can happen.

STAGE 1 The recurrence

Ask yourself Suppose T_1 sits in S_k, with $2 \le k \le n-1$. What happens to passengers $T_2, \dots, T_{k-1}$? When T_k arrives, which seats are free, and how does the situation compare with a smaller train?

STAGE 2 The answer

Ask yourself $P_2 = P_3 = \frac{1}{2}$. Guess P_n and prove it by strong induction.

STAGE 3 The penultimate passenger

Ask yourself Try to find a slicker argument. At the end, which seat is left for T_n? Could it be S_2?

Try this next

1. **Two forgetful passengers.** If the first *two* passengers both choose at random, what is the probability that the last gets their own seat?
2. **Displaced passengers.** Verify the expected number of displaced passengers for $n = 3$ by listing the possibilities.
3. **An indirect route.** Show, using the recurrence, that $\sum_{r=2}^{n-1} P_r = \frac{n-2}{2}$ is consistent with the symmetry argument.
4. **The last seat.** Show that, conditional on the last passenger not getting their own seat, the last passenger gets S_1 with probability 1. Why?
