12.8 Penney's Game

WORKSHEET

The question

STEP III 2001, Question 13

Read the question before you go on. It is in the STEP Support Programme's question database:

step.maths.org/questions/01-s3-q13

Hints

Try the question on your own first. If you get stuck, read the hints *one at a time*, and go back to the question after each one. Hints marked *Pause and try* are the key steps.

Ask yourself Suppose the tosses so far end in TT and nobody has won yet. Can THH ever appear before TTH?

STAGE 1 States

Ask yourself Neither sequence can be completed in two tosses. After two tosses, what is the next toss's effect from each state?

STAGE 3 *B* against *C*

Ask yourself *C* wants HHT and *B* wants THH. When does *C* win? (Look at what must come just before the first HH.)

Try this next

1 **Four players together.** (From STEP II, 2015.) Players choose HHT, THH, TTH and HTT. Show that if only HHT and THH play, HHT wins with probability $\frac{1}{4}$. If all four play together, show that each wins with probability $\frac{1}{4}$. If only THH and TTH play, find the probability that TTH wins.

2 **Waiting times.** Show that the expected number of tosses until HH first appears is 6, and until HT is 4. (Use first-step analysis.)

3 **The best reply.** For each of the eight sequences of length three, find the sequence that beats it with the greatest probability. Which sequence is beaten most easily?

4 **Conway's formula.** Use Conway's formula to check that HHT beats HTT with probability $\frac{2}{3}$.
