5.5 Rational Angles That Aren't

WORKSHEET

The question

STEP III 2022, Question 8

Read the question before you go on. It is in the STEP III paper in OCR's download of the 2022 STEP papers (a zip file):

www.ocr.org.uk/Images/696587-2022-past-papers.zip

Hints

Try the question on your own first. If you get stuck, read the hints *one at a time*, and go back to the question after each one. Hints marked *Pause and try* are the key steps.

Ask yourself Suppose θ were rational, say $\theta = \frac{p}{q}$ degrees. Find a positive integer k with $\sin(k\theta) = 0$.

STAGE 1 Multiple-angle formulas

Ask yourself Write $\cos k\theta + \mathrm{i}\sin k\theta = (\cos\theta + \mathrm{i}\sin\theta)^k$, and take out a factor of $\cos^k\theta$. What is left inside the bracket?

STAGE 2 Parity

Ask yourself If $\sin(k\theta) = 0$, the bracket $k - \binom{k}{3}(a^2-1) + \cdots$ must be zero. Every term after the first is a multiple of $a^2 - 1$. What does that tell you about k?

STAGE 3 The contradiction

Pause and try Apply the cosine formula with $m = \frac{1}{2}k$. Why can $\cos(m\theta)$ never be zero?

STAGE 4 The cotangent version

Ask yourself If $\cot\phi = \frac{1}{b}$, what is $\sec^2\phi - 1$? Is it even?

Try this next

1. **The tetrahedron.** Show that the angle between two faces of a regular tetrahedron is $\cos^{-1}\frac{1}{3}$, and that the angle between two bonds in a methane molecule (from the centre of a regular tetrahedron to two vertices) is $\cos^{-1}\left(-\frac{1}{3}\right)$.

2. **The 3–4–5 triangle.** Show that the smallest angle of a 3–4–5 triangle is an irrational number of degrees. (*Hint:* it is $\cot^{-1}\frac{4}{3}$; adapt the argument, or consider powers of the Gaussian integer $4 + 3\mathrm{i}$ and show none is real.)

3. **Why odd a?** What goes wrong in the argument when $a = 2$? Is $\cos^{-1}\frac{1}{2}$ rational?

4. **Niven for small cases.** Find all whole numbers of degrees θ between 0° and 90° for

which $\cos\theta$ is rational, and check that your list agrees with Niven's theorem.
